**Abstract**
The Social Cohesion Survey is a series of detailed surveys on social cohesion, immigration and population issues. A prime objective of the surveys is to further understanding of the social impact of Australia's increasingly diverse immigration program. The series of surveys forms part of the Scanlon Foundation Social Cohesion Research Program (SCRP) which commenced in 2007 under the direction of the Monash Institute for the Study of Global Movements (MISGM) and the Australian Multicultural Foundation (AMF). A key element of the SCRP was the conduct of a landmark Australian Social Cohesion Survey in 2007.

This is the second survey of the Social Cohesion Survey series, with the aims to:
• Look at current attitudes towards social cohesion, and
• Assess changes over time by comparing results obtained in 2009 to those obtained in 2007.

The 2009 survey used a randomly sampled 2,000 respondents with the sample stratified geographically. A minimum of 200 interviews was undertaken in each Australian state / territory (i.e. 1,600 interviews) with the remaining 400 interviews allocated across the five most populous states (i.e. NSW, Victoria, Queensland, WA and SA) in proportion to the population in those states. The study covered a variety of topics, including economic conditions, political participation, socio-cultural attitudes, discrimination, and local communities.

## Sampling

**Sampling Procedure**
One-stage stratified or systematic random sample

**Response Rate**
The response rate was defined as interviews as a proportion of interviews plus refusals. On this basis the final overall response rate for the 2009 survey was 51%.

**Weighting**
A “rim weighting” approach was used to adjust for differential survey response rates across age, gender and educational attainment and, where necessary, to also adjust for disproportionate aspects of the sample design (e.g.: disproportionate geographic distribution). Where possible, proportions were taken from the 2009 ABS population statistics rather than the 2006 data used in the previous surveys. “Rim weighting” was used to create weights which adjusted the data in-line with Australian Bureau of Statistics counts on these variables. The weights are created using a statistical regression approach which seeks to achieve the “best fit” possible with the population proportions specified by the weighting variables while disturbing the overall data as little as possible. The algorithm used for this purpose was provided in the Social Research Centre’s Quantum analysis software to develop sample weights which incorporate the variables state, age, gender, country of birth and educational attainment.

| **Data Collector(s)** | The Social Research Centre (SRC) |

**Supervision**
In addition to providing a 1800 number, offering to send an introductory letter and arranging for interviews in the agreed languages, the other response maximisation procedures that applied to the project included:
• Referring sample members to the Monash University number on an as required basis,
• Hosting a web-page containing responses to frequently asked questions on the Study for Global Movements (Monash University) website, and
• Ensuring appropriately trained interviewers worked on the survey (see also Section 4.2 of the Methodological Report).

## Data Processing & Appraisal

**Data Editing**
The data were checked by the archive for missing variable and value labels, out of range values and wild codes, logical inconsistencies, and confidentiality.
